2.1. Protocol Description

2.1.1. Overview

This document is intended as a guide for software developers responsible for creating the interface between a hospital (or laboratory) information system (LIS/LIMS/EMR) application and Yumizen P8000. It is assumed that these software developers are familiar with the HL7 standard and have the HL7 specification documents available for reference.

Message structure

The following table briefly describes concepts used when describing the HL7 high level protocol. For further details refer to the original HL7 standard specification.

Concept	Definition
Message	A complete, self-contained entity of data. An example of a message is a complete patient test result including patient identification, order information, parameter values and error messages.
Segment	A message is composed with segments each containing related elements of data (attributes). Examples of segments are the patient information segment keeping all the patient data that is common to all tests and the order segment keeping data that is common for the individual test.

Concept	Definition
Field	Each segment has a number of fields each holding one or more data elements (attributes). For instance, the patient information segment has a field containing the patients name and a field holding the patients birth date.
Component field	A field may be divided into several component fields. The name field of the patient information segment has the components last name, first name and middle initials.

Messages consist of segments of various types that are listed in the table below:

Segment Type	Name
MSH	Message Header Segment
MSA	Message Acknowledgement Segment
PID	Patient Identification Segment
PV1	Patient Visit Segment
ORC	Common Request Segment
TQ1	Timing/Quantity Segment
OBR	Observation Request Segment
SPM	Specimen Segment
OBX	Observation Result Segment
NTE	Notes and Comments Segment
SAC	Specimen Container Segment

To report results Yumizen P8000 sends messages to the LIMS as a sequence of segments.

Delimiters

Delimiters are used to separate the segment into fields and field components. Delimiters may vary from implementation to implementation, and are defined as part of the header segment.

The following delimiters are used in Yumizen P8000:

Delimiter	Name	Dec. Code	Hex. Code
	Field Delimiter	124	7C
~	Repeat field delimiter	126	7E
^	Component field delimiter	94	5E
&	Sub component delimiter	38	26
	Escape character	91	5C

Fields

A field is a string of characters.

HL7 does not take into account how systems store data within an application.

When fields are transmitted, they are sent as character strings.

Whether the field is required, optional, or conditional in a segment, this information is provided in the column labeled OPT.

The designations are:

Designation	Description
R	Required
RE	Required but may be Empty: The field or data type component description must stipulate when the field or data type component may be empty.
O	Optional
C	Conditional on the triggered event or on some other field(s). The field definitions following the segment attribute table should specify the algorithm that defines the conditionality for this field.
X	Not used with this triggered event
B	Left in for backward compatibility with previous versions of HL7. The field definitions following the segment attribute table should denote the optionality of the field for prior versions.
W	Withdrawn
CE	Conditional but it may be empty

Date Format

Dates are always sent as: YYYYMMDD.

Times are always sent as: HHMMSS.

Dates and Times together are sent as: YYYYMMDDHHMMSS. When Yumizen P8000 receives a Date or Date/Time, the following formats are allowed: YYYYMMDD, YYYYMMDDHHMM and YYYYMMDDHHMMSS.

Decimal values are transmitted with a “.” character as the decimal separator.

2.1.2. Interface Description

Yumizen P8000 needs to populate its own database with data regarding samples worked by laboratory instruments.

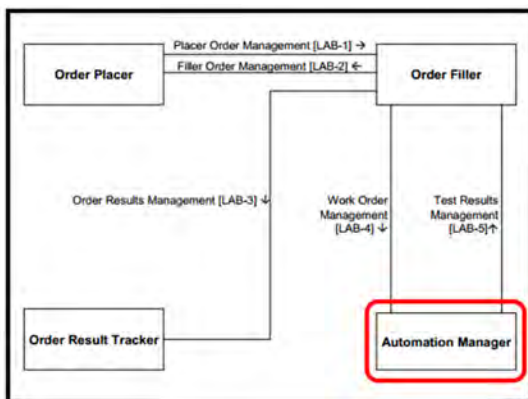

This information is usually received from an external system.

The Yumizen P8000 HL7 interface provides a correct data flow from that system to Yumizen P8000 database.

- The external system must encapsulate requests information in an HL7 message and send it to Yumizen P8000 HL7 interface. This process is called *requests downloading* in the Yumizen P8000 worklist.
- Yumizen P8000 is capable to send results regarding samples to an external system when result information is ready. The Yumizen P8000 HL7 interface encapsulates sample results data in HL7 messages and sends the messages to the external system. This process is called *results uploading* in the Yumizen P8000 workflow.
- The charset settings available are:
 - UTF-8 (used by default)
 - windows-1252
 - ISO-8859-15
- LIS must communicate with two lines (the connection remains after each result sent to LIS):
 - Port 10001 as client for requests sent from LIS to Yumizen P8000. The communication closes after the end of the message.
 - Port 10002 as server for results sent from Yumizen P8000 to LIS.

2.1.3. Automation Manager Scenario

This integration scenario applies when Yumizen P8000 plays the role of the Automation Manager. The connected external system (usually a LIS) is an Order Filler, as shown in the following diagram.

The transactions supported for this scenario are:

- The external system sends orders to Yumizen P8000 (requests downloading): the interaction is similar to one described in the transaction “*Work Order Management (LAB-4)*” of IHE Laboratory Technical Framework. As stated in the IHE document “*This transaction is used if the Order Filler issues a new order to the Automation Manager*”.
- Yumizen P8000 sends results to the external system (results uploading): the interaction is similar to one described in the transaction “*Test Results Management (LAB-5)*” of IHE Laboratory Technical Framework. As stated in the IHE document “*This transaction is used when Automation Manager transmits test results to Order Filler*”.

2.1.4. Message Structure

The following table lists the message types supported by Yumizen P8000 for the laboratory testing workflow transactions:

Message	Description
OML^O33 Laboratory order for multiple order related to a single specimen	Specimen oriented order information used to send request from an external system to Yumizen P8000 (requests downloading).
ORL^O34 Laboratory order response	Application Acknowledgement/Rejection of a request message send from Yumizen P8000 to an external system.
OUL^R22 Unsolicited Specimen Observation Message	Specimen oriented result values used to send results from Yumizen P8000 to an external system (results uploading).
ACK Generic Acknowledgement Message	Commit Acknowledgement/Rejection of a message used for both request and result message.

2.1.4.1. OML^O33^OML_O33

The following table lists the detailed structure for message OML^O33 used to send request from an external system to Yumizen P8000:

Segment	Meaning	Usage	Card.
MSH	Message Header	R	[1..1]
[--- PATIENT begin	R	[1..1]
PID	Patient Identification	R	[1..1]

2.1.4.2. OUL^R22^OUL_R22

The following table lists the detailed structure for message OUL^R22 used to send results from Yumizen P8000 to an external system.

Segment	Meaning	Usage	Card.
MSH	Message Header	R	[1..1]
[PID]	Patient Identification	R	[1..1]
PV1	Patient Visit	R	[0..1]

]]	--- RESULT end		
}	--- ORDER end		
}	--- SPECIMEN end		

2.1.4.3. ORU^R01

The following table lists the detailed structure for message ORU^R01 used to send QC results from Yumizen P8000 to an external system.

Segment	Meaning	Usage	Card.
MSH	Message Header	R	[1..1]
{	--- ORDER begin	R	[1..*]
OBR	Observation order	R	[1..1]
[[--- RESULT begin	R	[0..*]
OBX	Observation Result	R	[1..1]

}	--- ORDER end		

2.1.4.4. ACK / ORL^O34^ORL_O34

The following table lists the detailed structure for message ACK used to acknowledge message reception by both Yumizen P8000 and an external system:

Segment	Meaning	Usage	Card.
MSH	Message Header	R	[1..1]
MSA	Message Acknowledgement	R	[1..1]
[ERR]	Error	O	[0..1]

2.2. OUL and OML Messages Segments

2.2.1. MSH - Message Header Segment

The MSH segment defines the intent, source, destination, and some specifics of the syntax of a message.

The Message Header segment contains general information and identifies the sender. The Message Header segment is always the first record in a transmission.

2.2.5. OBR - Observation Request Segment

In the reporting of clinical data, the OBR serves as the report header. It identifies the observation set represented by the following atomic observations. It includes the relevant ordering information when that applies. It contains many of the attributes that usually apply to all of the included observations.

The Universal Service Identifier field corresponds to any parameters or compatible panels:

CBC
DIF
RET
SLIDE
CBF
RBC_PLTO

- To request a CBR, send CBC in one group of ORC, TQ1 and OBR frames and RET in another group of ORC, TQ1 and OBR frames.
- To request a DIR, send CBC in one group of ORC, TQ1 and OBR frames, a DIF in another group of ORC, TQ1 and OBR frames and RET in another group of ORC, TQ1 and OBR frames.

2.2.8. NTE - Notes and Comments Segment

The NTE segment is defined here for inclusion in messages defined in other chapters. It is commonly used for sending notes and comments.

NTE segment is always and exclusively linked to a parameter numerical value.

2.2.8.1. From Yumizen P8000 to LIS

The instrument flag linked to a parameter is sent with the possible following values:

- *: if suspected
- X: if rejected
- Characters string

2.2.9. OBX - Observation Result Segment

The OBX segment is used to transmit a single observation or observation fragment. It represents the smallest indivisible unit of a report.

The LIS can transmit clinical information and/or previous values (according on the ORC.1) using the OBX segment.

2.2.9.1. From LIS to Yumizen P8000

SEQ	LEN	OPT	Card.	Element name	Example

For field 3 and 5, the LIS must only send one type of element at the same time: comment code or free text.

- To apply rules on the clinical comments, send a comment code in field 3 and let field 5 empty.
- To have free comment, send free text in field 5 and let field 3 empty.

2.2.10. MSA - Message Acknowledgment Segment

The MSA segment contains information sent while acknowledging another message.

Acknowledgment codes explanation

Value	Description
AA	Application Accept - Enhanced mode: Application acknowledgment: Accept
AE	Application Error - Enhanced mode: Application acknowledgment: Error
AR	Application Reject - Enhanced mode: Application acknowledgment: Reject

2.2.10.1. From LIS to Yumizen P8000

SEQ	LEN	OPT	Card.	Element name	Example
0	3	R		Segment ID	MSA
1	2	R	[1..1]	Acknowledgment Code	AA
2		R	[1..1]	Message Control ID	YP8K20160705100955
3		X		Text Message	
4		X		Expected Sequence Number	
5		X		Delayed Acknowledgment Type	
6		X		Error Condition	

Example of a message acknowledgment segment from LIS:
MSA|AA|YP8K20160705100955

2.2.10.2. From Yumizen P8000 to LIS

SEQ	LEN	OPT	Card.	Element name	Example
0	3	R		Segment ID	MSA
1	2	R	[1..1]	Acknowledgment Code	AA
2		R	[1..1]	Message Control ID	18698910009
3		X		Text Message	
4		X		Expected Sequence Number	
5		X		Delayed Acknowledgment Type	
6		X		Error Condition	

Example of a message acknowledgment segment from Yumizen P8000:
MSA|AA|18698910009

2.2.11. SAC - Specimen Container Segment

2.2.11.1. From Yumizen P8000 to Host

The goal of this segment is to inform that the sample is currently in analysis inside the instrument.

To configure this segment, refer to the RAS1117 - Configuring the LIS Connection procedure.

SEQ	LEN	OPT	Card.	Element name	Example
0	3	R		Segment ID	SAC
7	14	R		Event date	20170725121422

^a: This field is configurable by user.

SEQ	LEN	OPT	Card.	Element name	Example
8		R		Event code ^a	CHECK_IN
		R		Event description ^a	CheckIn / Manual CheckIn
		R		User or device that triggered the event	YH2500-YH2500
10	6	C		Rack number	748565
11	2	C		Position in rack	7

^a: This field is configurable by user.

Example of an automatic check in:

SAC|||||20220516143527|CHECK_IN^CheckIn^YH2500 - YH2500||748265|7

Example of a manual check in:

2.2.12.2. Suspected Pathologies

Suspected pathologies are transmitted through one Comment record located after the corresponding Result record. If several pathologies are suspected, they are transmitted through several NTE frames.

Refer to [NTE - Notes and Comments Segment](#).

2.5. Minimal Lower Layer Protocol

This section describes a minimal HL7 lower level protocol to be used in a pure network environment. It is an adaptation of the hybrid lower layer protocol. It is assumed that this HL7 protocol is used only in a network environment. Most of the details of error detection and correction are handled by the lower levels of any reasonable network protocol and do not require any supplementation.

The goal of this lower level protocol (LLP) is to provide an interface between HL7 and the network that uses minimal overhead while remaining compatible with other LLPs.

Other types of links, such as RS-232 to a communication server, require another protocol to guarantee their integrity. This version of the lower LLP differs significantly from other lower level protocols in that it has only a single byte to signal the start of a message and two bytes to signal the end of a message. There is no other lower level header or trailer information. There are no other characters added to the HL7 message.

Notation conventions:

1. Single ASCII characters are enclosed in single quotes.
2. Special characters or non-printing ASCII characters are enclosed in angle brackets, <>.

Special characters are the LLP Start Block and End Block characters.

Non-printing ASCII characters may be written as their abbreviation, e.g., ESC for the Escape character. They also may be written as their hex value in the form 0xXX where X is a hexadecimal digit.

For example in Standard ASCII, <ESC> is <0x1B>.

BLOCK FORMAT

HL7 messages are enclosed by special characters to form a block. The format is as follows:

```
<SB>dddd<EB><CR>
```

```
<SB>
```

Start Block character (1 byte)

ASCII <VT>, i.e., <0x0B>.

This should not be confused with the ASCII characters SOH or STX.

```
dddd
```

Data (variable number of bytes)

This is the HL7 data content of the block.

The data can contain any displayable ASCII characters and the carriage return character, <CR>.

```
<EB>
```

End Block character (1 byte)

ASCII <FS>, i.e., <0x1C>.

This should not be confused with the ASCII characters ETX or EOT.

<CR>

Carriage Return (1 byte)

The ASCII carriage return character, i.e., <0x0D>.

3. QC to LIS

3.1. Overview

The YumizenLis driver can send QC results on the same channel as patient results among which:

- QC sample ID
- QC LIS test code
- QC result value
- QC result date and time
- QC result units
- QC result device/instrument ID

Detailed information is sent to LIS, such as:

- Comments
- Target values
- Deviations
- Violated rules
- Laboratory's technician user ID validator

By default, all those information is sent.

A detailed structure is available, refer to the *QC to LIS - Detailed Structure* chapter.

To deactivate this function, refer to the technical manual.

Message structure

The following table lists the detailed structure for QC message from Yumizen P8000 to the LIS:

Segment	Meaning	Usage	Card.
MSH	Message Header	R	[1..1]
OBR	Observation Order	R	[1..1]
OBX .1	Observation Result (first parameter)	R	[1..n]
OBX .2	Observation Result (second parameter)	R	[1..n]
OBX .n	Observation Result (n parameter)	R	[1..n]
FS	File Separator	R	[1..1]
CR	Carriage return	R	[1..1]

QC can be resent to LIS.
In case of resending, only controlled parameters are resent to LIS.

3.2. LIS to Yumizen P8000 ACK / NAK

The reply expected from the LIS in response to a QC result message is the standard HL7.

The reply must be sent by the LIS on the same channel used by the Yumizen P8000 to send QC result messages (standard results channels). The LIS can accept or refuse the QC result message. This data is saved on the Yumizen P8000 so that the QC result will no longer be sent to the LIS.

Message structure

The following table lists the ACK structure for a message from the LIS to the Yumizen P8000:

Segment	Meaning	Usage	Card.
MSH	Message Header	R	[1..1]
MSA	Message Acknowledgment	R	[1..1]
[ERR]	Error	R	[0..1]
FS	File Separator	R	[1..1]
CR	Carriage return	R	[1..1]

Example of a reply from the LIS:

```

Example of a QC message sent to the LIS:

OBX|2|NM|HGB||165.2001|g/L||||F|||20210413104907||||Yumizen 1<CR>

QC result is sent to the LIS as soon as it is considered as valid or confirmed when the user has taken a decision (accepted, rejected or ignored), see details below.

Three OBX segments follows the OBX segments linked to the n parameters.

They describe the status of the QC results as in Yumizen P8000 software:

- QC_RESULT_STATUS
- QC_RESULT_IN_STATISTICS
- LOT_DESCRIPTION

QC result conditions	QC_RESULT_STATUS	QC_RESULT_IN_STATISTICS
All parameters are within tolerance ranges or comply with Westgard rules	VALID	TRUE
A failed QC has been accepted by the user	ACCEPTED	TRUE
A failed QC has been rejected by the user	REJECTED	TRUE or FALSE depending on user decision
A failed QC has been ignored by the user	IGNORED	FALSE

	Values	Note
LOT_DESCRIPTION	ABX Diftrol	-
	ABX Minotrol Retic	
	BFTROL	
	UNKNOWN	If the lot is not defined in the Yumizen P8000

4. QC Export

4.1. QC Results Availability

Specific settings must be done in Yumizen P8000 to setup the QC export functionality, RAS1115 - Configuring the Application procedure.

Contact your HORIBA Medical technical representative if necessary.

To share QC results with external systems (like LIS or QC expert system), the Yumizen P8000 is generating csv (or xml) files with all results send by the instruments.

The files are available through a FTP connection, on the Yumizen P8000 Server.

The name of the user for the FTP server is **qc_p8000**. The password is **123456789**.

For each export, one or several files are available in CSV or XML format.

As soon as the file has been downloaded, the external system deletes automatically the CSV or XML file.

4.1.1. CSV - File Example (Semicolon Separated) – Used by Default
